# Monitoramento METOS®

A semana começa com a atuação de uma frente fria que provoca chuvas bem distribuídas na Região Sul já na segunda-feira, avançando na terça para o Sudeste e Centro-Oeste e mantendo as instabilidades nessas áreas. A partir de quarta-feira, com o deslocamento do sistema para o oceano, os maiores volumes se concentram entre o sudeste de Minas Gerais e o Espírito Santo, onde as chuvas persistem até o domingo. No Nordeste, as precipitações se concentram no sul e litoral da Bahia, além de pontos do oeste baiano, Maranhão e Piauí, enquanto o tempo segue firme e seco nas demais áreas, com calor intenso e baixa umidade relativa do ar.

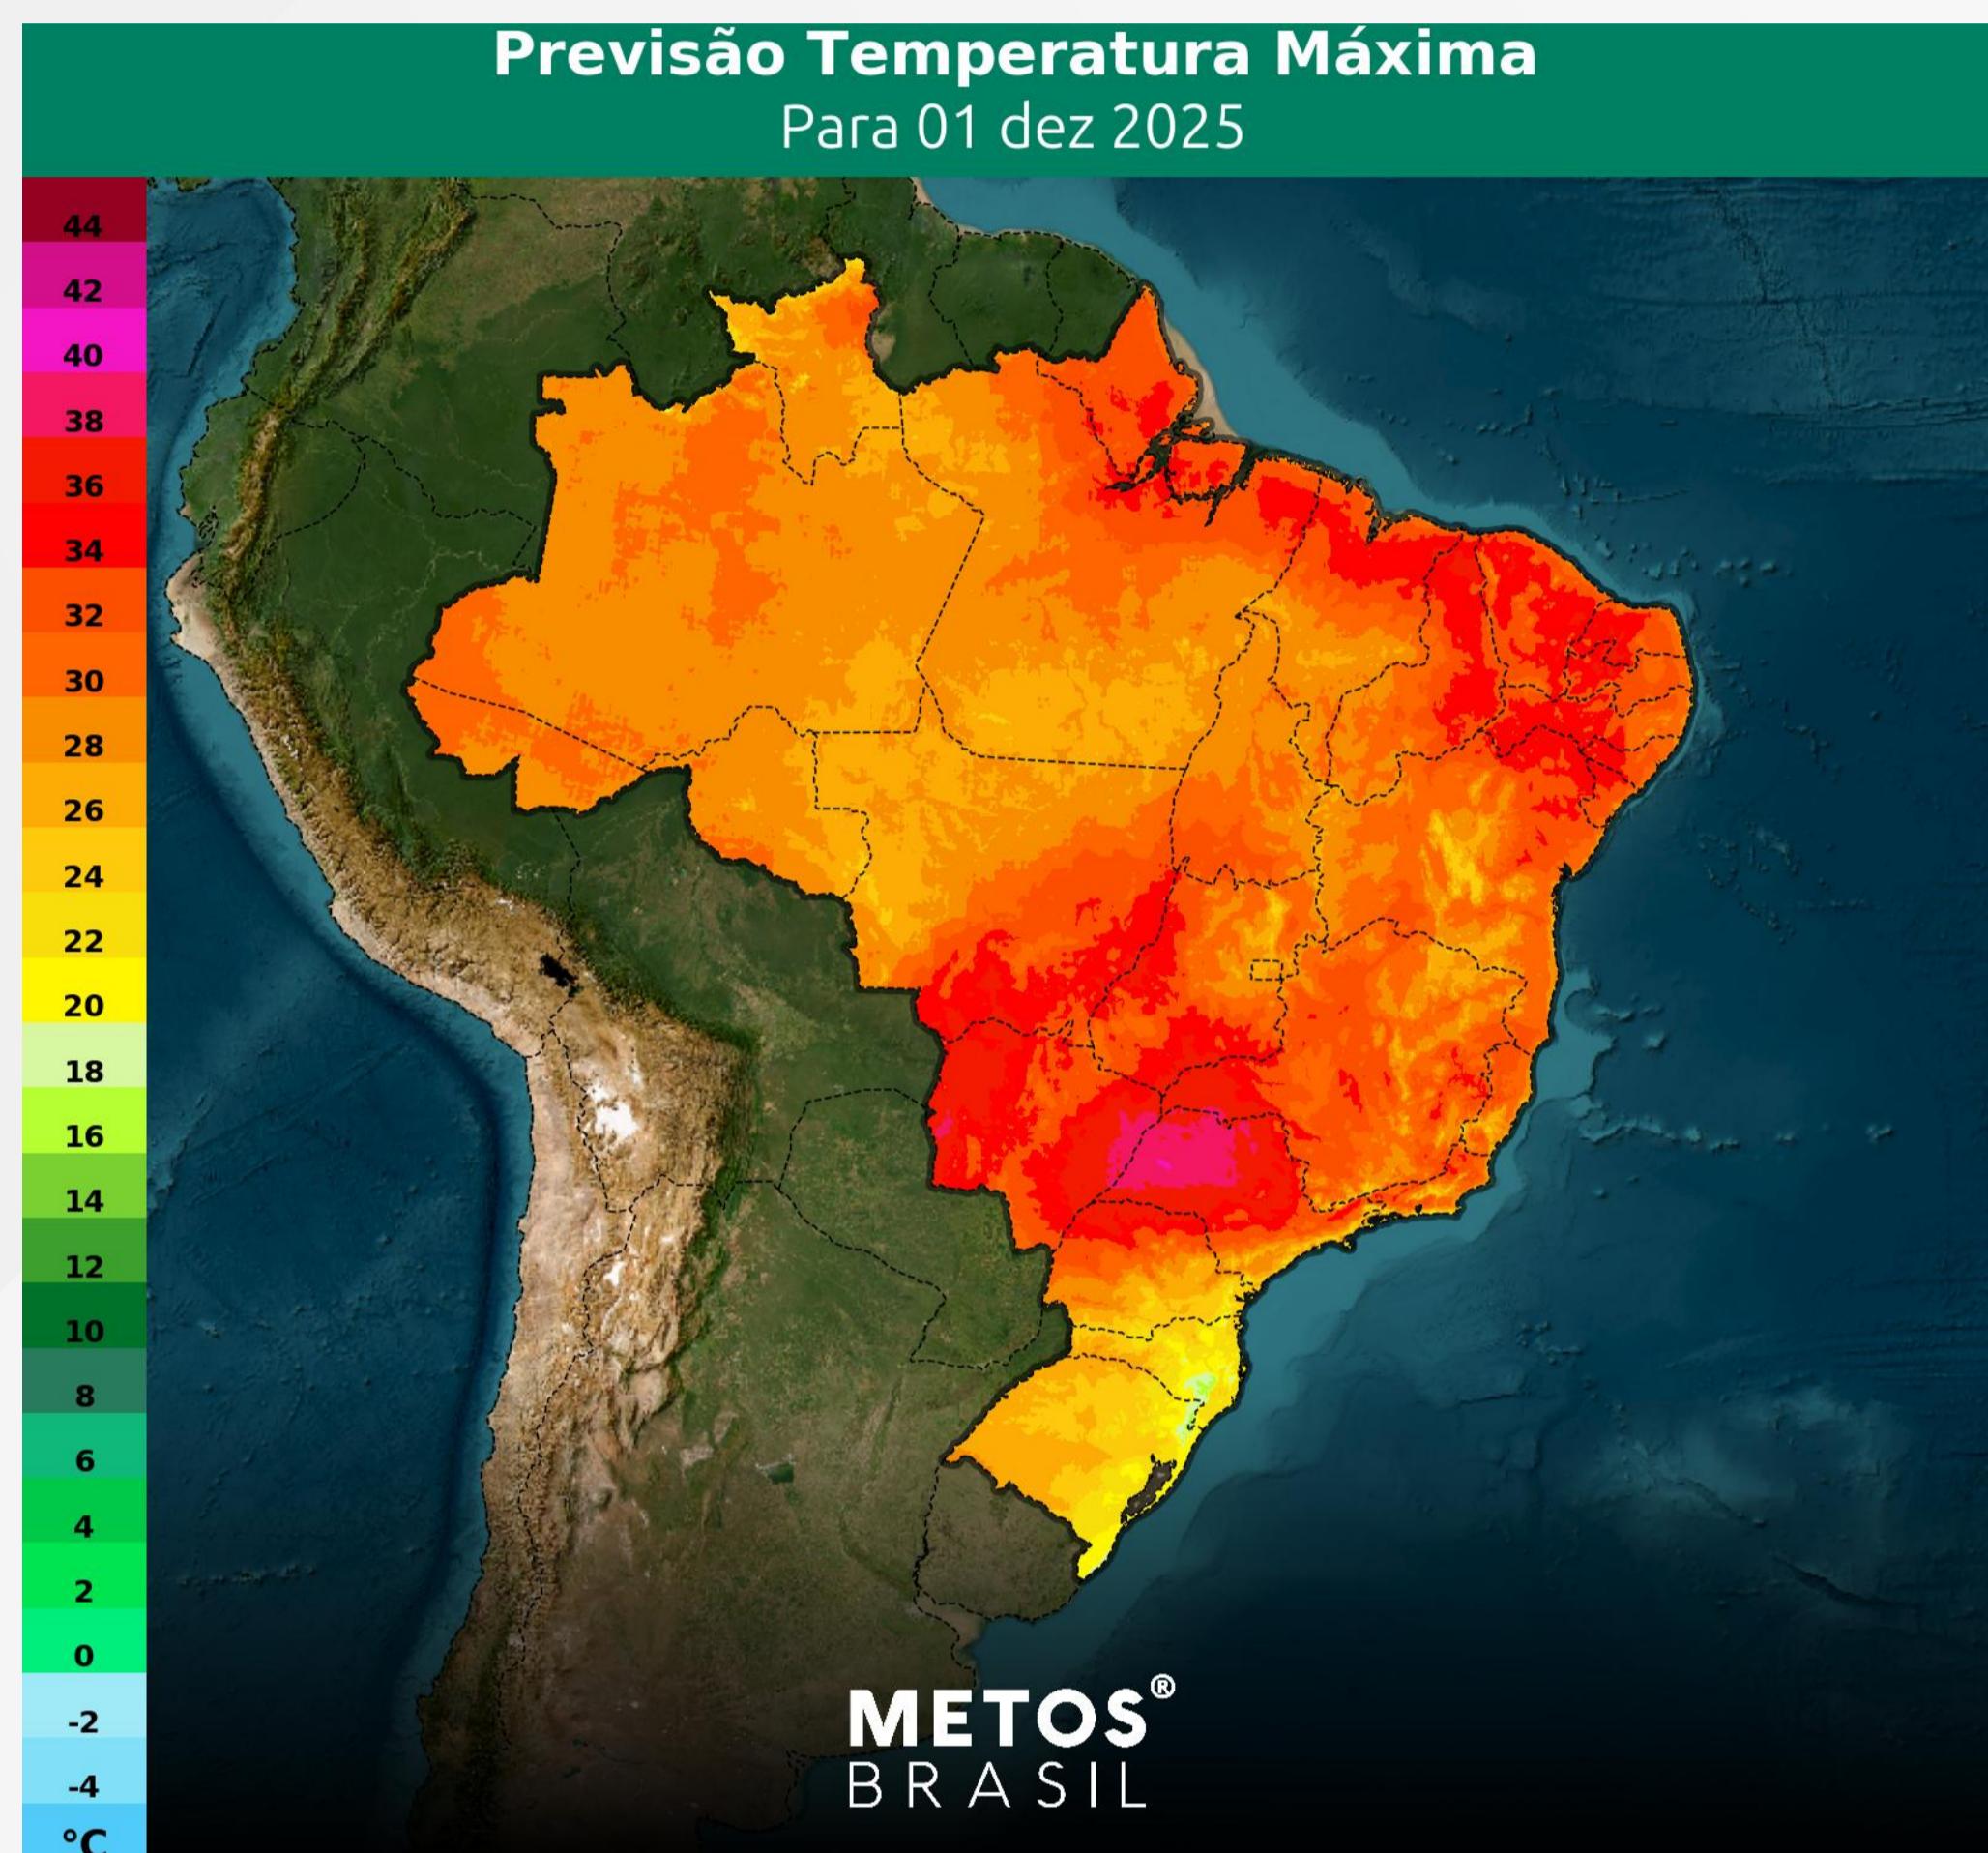

As temperaturas iniciam a semana em elevação, com destaque para o oeste de São Paulo, onde os termômetros podem alcançar os 38 °C. Após a passagem da frente fria, espera-se leve declínio nas mínimas, especialmente no Sul e em parte de Minas Gerais, sem risco de geadas. No Nordeste, o calor persists, principalmente entre o Piauí, Ceará e interior do Rio Grande do Norte. Com os volumes de chuva previstos, a umidade do solo tende a se recuperar, com destaque para o Mato Grosso do Sul, Maranhão, Piauí e Bahia, regiões que vinham registrando déficits e agora apresentam melhora nas condições hídricas para a atividade agrícola.
