Monitoramento METOS®

Com o início de dezembro, a região Centro-Oeste entra em um período tipicamente mais úmido, essencial para o avanço da safra de verão. A semana começa com chuvas isoladas no Mato Grosso do Sul e no noroeste do Mato Grosso. A partir de terça-feira, a instabilidade ganha força e se espalha por toda a região, favorecida pela presença de uma frente fria e pela umidade proveniente da região Norte. Os maiores acumulados são esperados entre quinta e sábado, com destaque para áreas do Mato Grosso, leste de Goiás e, especialmente, o Distrito Federal no sábado. No domingo, as chuvas tendem a se concentrar entre o norte de Mato Grosso e Goiás. Esse padrão garante bons volumes e contribui para a recuperação da umidade do solo, beneficiando diretamente o desenvolvimento das lavouras.

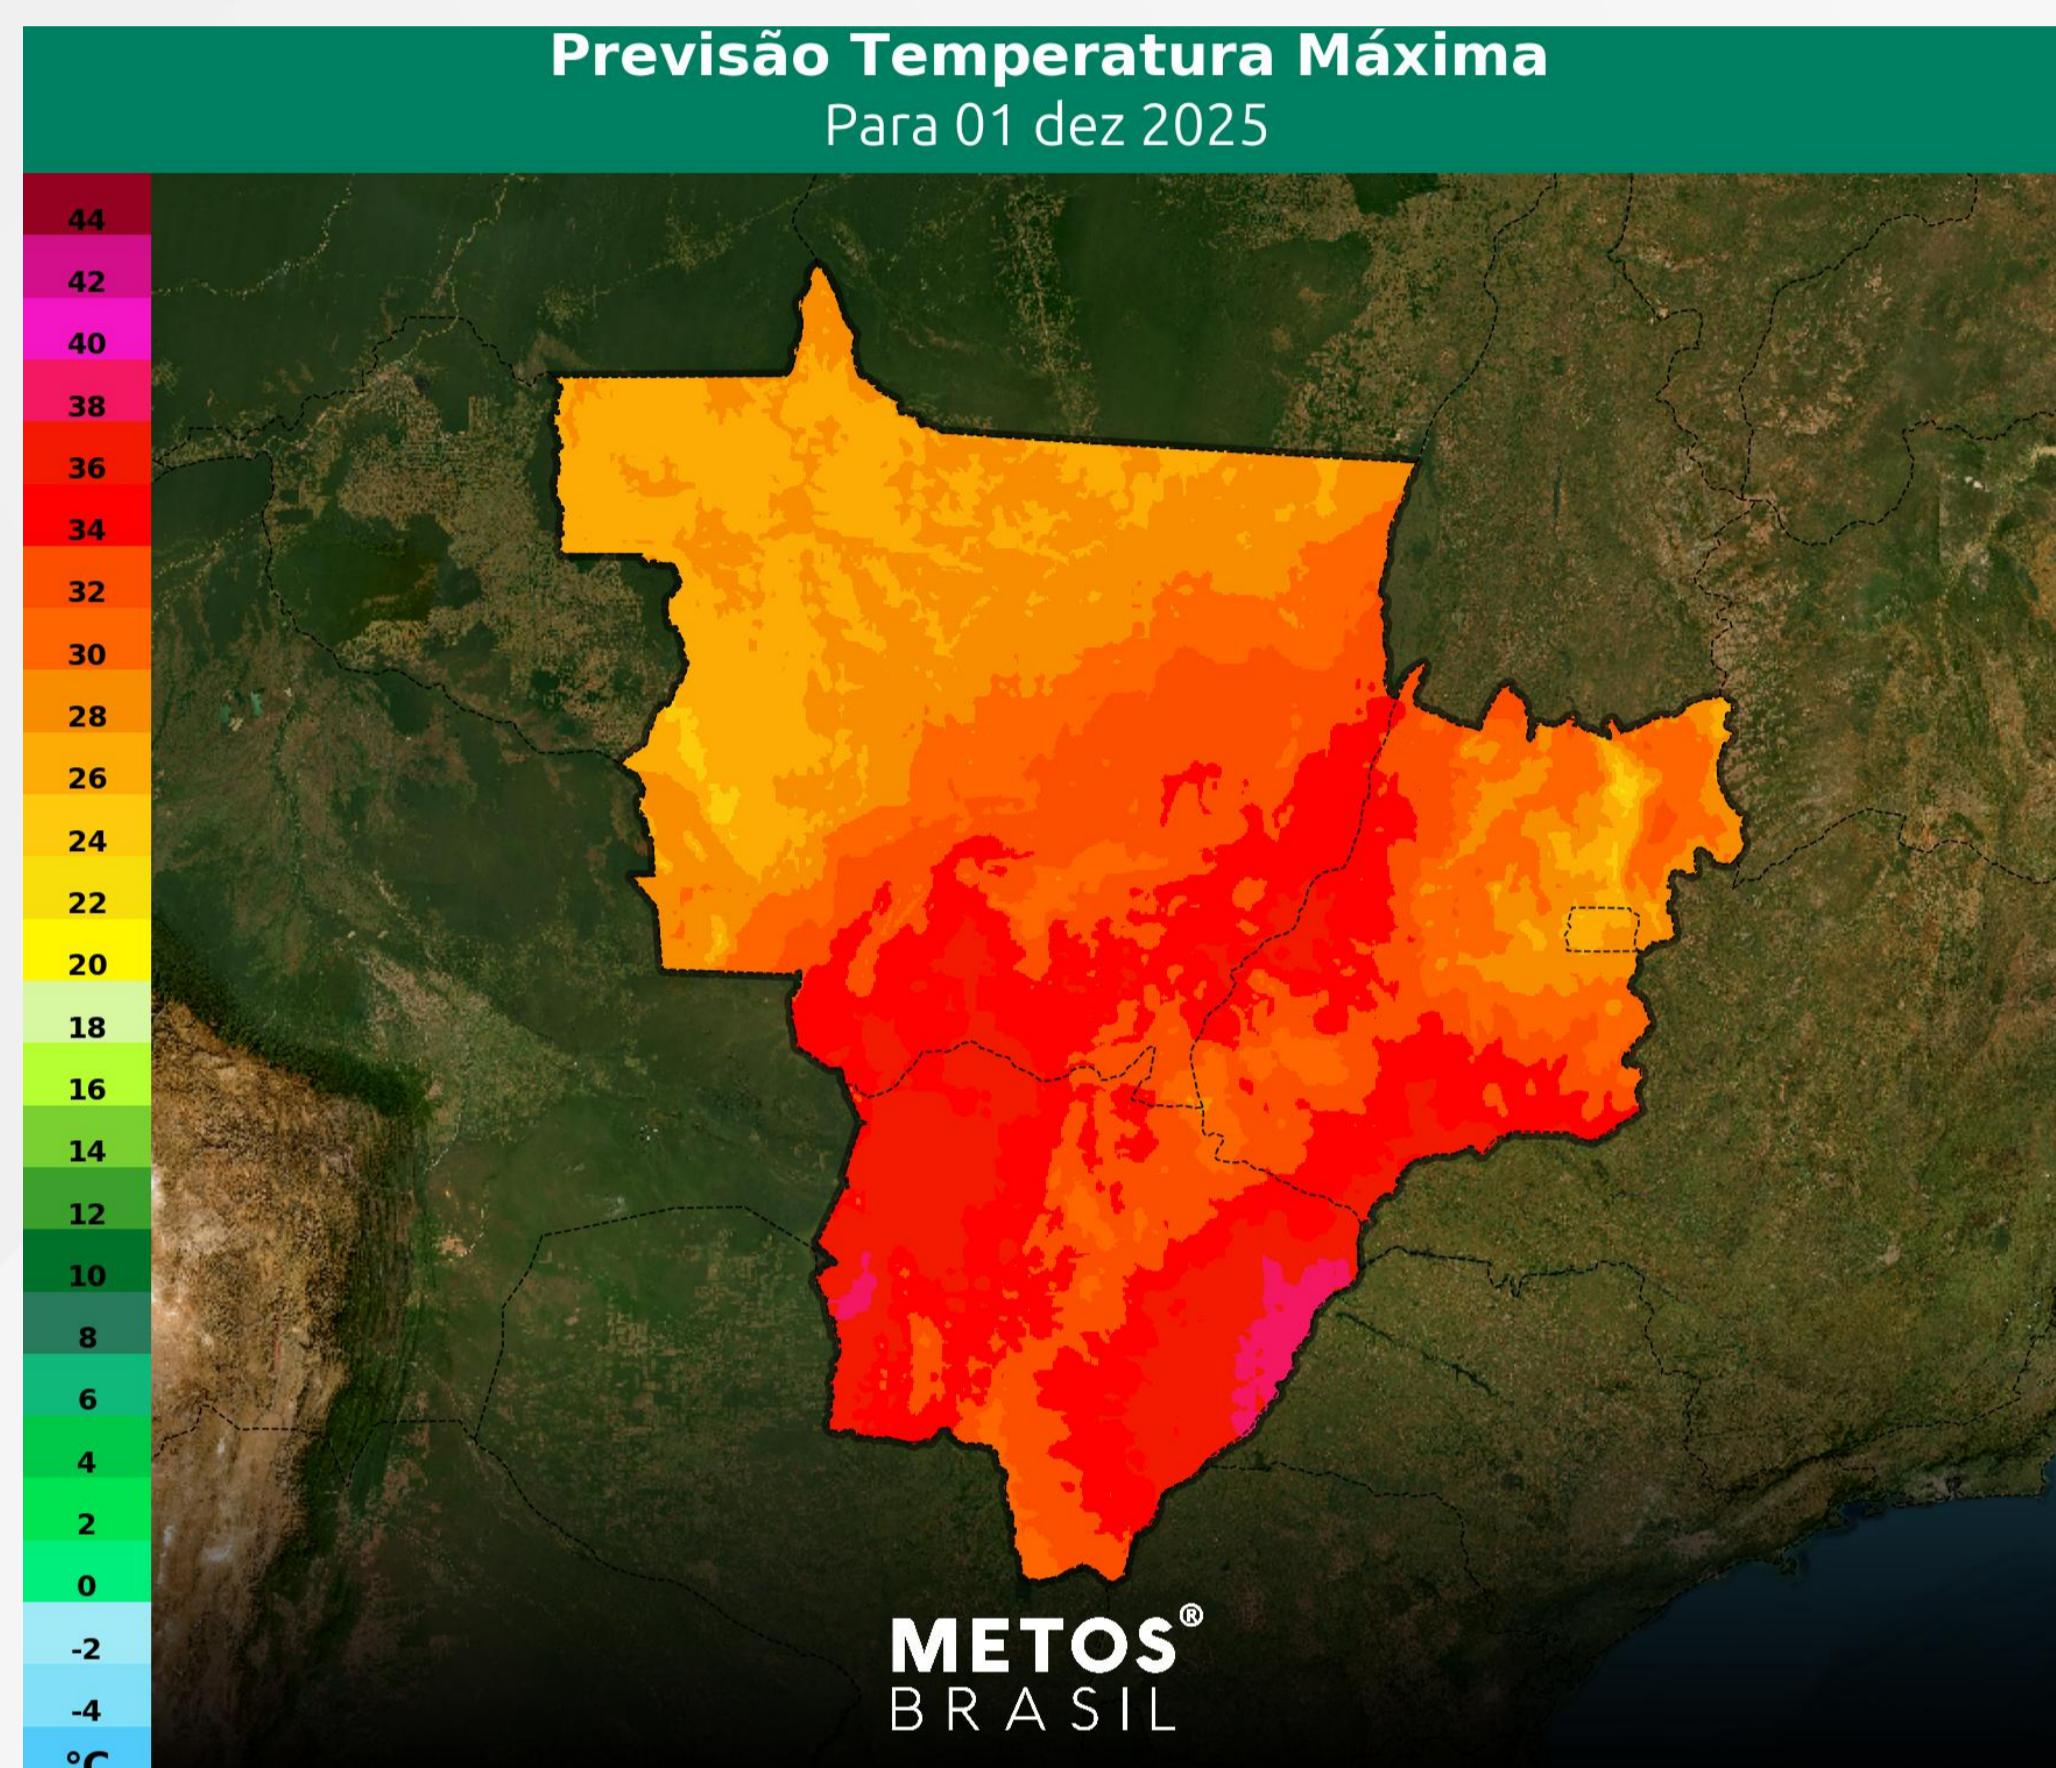

Com relação às temperaturas, a presença de nebulosidade durante boa parte da semana ajudará a amenizar o calor intenso, principalmente nas áreas com chuva frequente. No entanto, com a diminuição das nuvens a partir de sexta-feira, o calor volta a ganhar força, especialmente no Mato Grosso do Sul e no oeste de Mato Grosso, com máximas elevadas no fim do período.
